Android deep linking — checklist for the developer

Website status: `https://catly.in/.well-known/assetlinks.json` is live (200, application/json) with package `com.example.project_c` and SHA-256 `FB:6B:B8:57:1C:1F:9C:DB:C9:1E:F5:74:4B:DF:F7:35:D4:1C:7D:BF:14:4E:D6:D6:E9:00:08:A3:F8:A1:31:23`.
Note: `www.catly.in` redirects to `catly.in`, and Android does not follow redirects, so use host `catly.in` only.

1. AndroidManifest.xml — on the main Activity
```xml
<intent-filter android:autoVerify="true">
    <action android:name="android.intent.action.VIEW" />
    <category android:name="android.intent.category.DEFAULT" />
    <category android:name="android.intent.category.BROWSABLE" />
    <data android:scheme="https" android:host="catly.in" android:pathPrefix="/store" />
</intent-filter>
```
- Use `https` only; do not mix in custom schemes in this same filter.
- Do not add `www.catly.in` (verification would fail for it because of the redirect).
- `applicationId` in `build.gradle` must be exactly `com.example.project_c`.

2. Flutter (if the app is Flutter)
- Add the intent filter above to `android/app/src/main/AndroidManifest.xml`.
- Handle the incoming link with `app_links` (or `go_router`) and open the store for the slug in `/store/<slug>`.
- If using `go_router` deep links, add `<meta-data android:name="flutter_deeplinking_enabled" android:value="true" />`.

3. Match the signing key
- Run `./gradlew signingReport` (or `keytool -list -v -keystore <file>`) for the build installed on the phone.
- If its SHA-256 differs from the one above (debug or upload key), send it back — it will be added to the website file alongside the current one.
- Play Store builds use the key from Play Console → App integrity → App signing.

4. Re-verify on the phone
```
adb shell pm verify-app-links --re-verify com.example.project_c
adb shell pm get-app-links com.example.project_c
```
- Expected: `catly.in: verified`. If it says `none`, `1024` or `legacy_failure`, send the output.
- Or simply uninstall and reinstall the app.

- Android settings → Apps → Catly → Open by default → "Open supported links" should be on, with catly.in listed.

5. Test correctly
- Tap a link like `https://catly.in/store/<real-store-name>` from WhatsApp, Notes or Messages.
- Do not type it into the Chrome address bar — that stays in the browser.
- Quick test: `adb shell am start -a android.intent.action.VIEW -d "https://catly.in/store/test"`.

6. Optional online check
Google's tester:
`https://digitalassetlinks.googleapis.com/v1/statements:list?source.web.site=https://catly.in&relation=delegate_permission/common.handle_all_urls`
